Carrots Information Pack

Introduction

We think of carrots as a staple crop with year round supply, but even these have a season! In the UK, carrots will be planted out in Feb/March and begin harvest in May. Luckily, they store well in the ground or in cold store. We work with a collective of farmers across the UK growing different varieties at different latitudes to ensure a consistently available crop.

Farm information

At this time of year our carrots are from Secrett's farm in Surrey. Greg and the team harvest all their crops to order, hugely reducing waste and guaranteeing freshness.

More

Carrots are a key vegetable in plugging that hungry gap between the old and new growth in early spring. We love telling the story of how we use varieties and geography to ensure year-round supply.

Carrots are a rich source of beta-carotene, the pigment that gives them their orange colour and which the body converts into vitamin A. This micronutrient is essential for eye health, immune function, and skin integrity. They also provide useful amounts of vitamin K1, potassium, and vitamin B6, along with vitamin C and folate in smaller quantities. Beta-carotene is better absorbed when carrots are cooked and eaten with a small amount of fat, i.e. when roasted in olive oil.
